1. Task

The core of this project is the Custom Bouquet Builder. This feature allows users to move beyond pre-made arrangements and design a gift from scratch, selecting specific stems, wrappers, and extras.

2. Users

Our primary users are what we call "Thoughtful Givers." These are customers who value personalization and want a hands-on role in the gifting process.

3. Approach

To understand this better, we're using a Cognitive Approach. We want to map out the mental decisions a user makes to ensure the interface feels natural and not frustrating.

4. Task Analysis & User Flow

- Discovery & Selection: The user browses the digital garden, picking individual flowers and adding them to a specialized "flower cart."
- The Transition: Instead of a standard checkout, they select the "Make-the-Bouquet" option, which moves their selected flowers into a virtual design space.
- The Personal Touch: This is where the add-ons come in. Users layer their bouquet with specific wrappers and ribbons, or perhaps tuck in a teddy bear to finish the look.
- Refinement: The user visualizes the final product, making small mental adjustments before finalizing the order.

5. Documenting the Process

Step	**Action**	**Potential Challenge**
Step 1	Browse and select individual stems.	the user knows how many stems fill a bouquet.
Step 2	Enter the "Design Mode."	Making the transition from the shop to the builder seamless.

Step 3	Choose aesthetics (wrappers/ribbons).	Providing enough color options without overwhelming them.
Step 4	Final Review & Add-ons.	the "extra" items (like bears) are clearly displayed.

6. Reflection

By analyzing this task through a cognitive lens, I realized that building a bouquet is as much about the feeling of creating as it is about the purchase. This analysis helps me simplify the UI so that the technology stays in the background, allowing the user’s creativity to take center stage. It ensures we don't just have a shop, but a digital experience that feels as tactile as a real florist’s table.
